## Системы окрашивания SPEEDY-COLOR

The innovative and patented “speedy-color” system, along with the traditional dyeing procedures, enables special treatments which guarantee significant savings in energy, steam, water and reducing costs of production; thanks to a liquor ratio and a reduction in cycle times.

The operation is carried out through a turbine centrifuge, which is installed on the front door of the machine. This atomises and homogenizes the wash, operating a continuous circulation in the middle of the drum. The motor is controlled by an inverter.

The function of the turbine centrifuge homogenizes the dyeing wash or the chemical products inside the drum improving the penetration of the colour through the fibres of the fabric. The operation can be used for all types of garments and fibres which makes this system extremely flexible and increases the load capacity compared to traditional systems.

The “speedy-color” system can also be installed on existing machines. The system is set-up to receive, through collectors, the introduction of auxiliary products such as resins, softeners, enzymes as well as the insertion of gas or steam.

The management is carried out through a special software which manages the functioning of the machine and the control parameters of the turbine centrifuge. The recipes can be stored through the software and guarantee an easy management of the production procedure through the memorising is parameters thanks to the possibility of reproducing the treatments.
